

IN THE SPECIFICATION:

Please amend the following paragraphs as indicated:

[07] The host computer (100) typically includes a monitor (104). The monitor (104) is used to interface with the user by displaying the output of the application the user is working with. User input devices, such as a keyboard and mouse (105) are used to allow the user to input or manipulated data being processed by the application running on the host computer (100). In this way, the user can create the desired result, be it a document, graphic, etc.

[37] As acknowledged above, the connection between the host computer (100) and the printer (101) may be a direct serial or parallel connection, or may be a network (e.g., a local area network) to which both the host computer (100) and the printer (101) are connected. Additionally, the “printer” (101) may be any device that receives data from a computer or computerized system and renders that data as a hard copy document ~~or paper on paper~~ or some other print medium.

[61] After the graphic elements of the print job have been identified, the print quality of the regions containing those identified graphic elements will be set. If the user has specified a default print quality setting for identified graphic elements in a print job, the print quality setting can be automatically set accordingly (172). Alternatively, the user input routine (161) may be ~~activate~~ activated to solicit user print quality settings for all or individual graphic elements in the print job.
